<sup>1</sup> [Operative Mortality](#) is defined as patient death occurring in the hospital after isolated CABG surgery, regardless of length of stay, or death occurring anywhere after hospital discharge but within 30 days after the isolated CABG surgery. Hospital ratings are risk-adjusted using a statistical technique that allows for fair comparison of hospital outcomes even though some hospitals have sicker patients than average.

# The performance rating is based on a comparison of each provider's risk adjusted mortality rate to the California observed mortality rate. A provider is classified as "Better" if the upper 95% confidence limit of its risk-adjusted mortality rate falls below California observed mortality rate. A provider is classified as "Worse" if the lower 95% confidence limit of its risk-adjusted mortality rate is higher than the California observed mortality rate. A provider is classified as "Average" if the California mortality rate falls within the confidence interval of the provider's risk adjusted mortality rate.

\* Overall and hospital results are not shown because data necessary to confirm deaths was not available.

† The number of CABG cases by surgeon may not equal the total number of CABG cases reported due to various reasons, including unresolved issues of surgeon case attribution and cases not appearing for surgeons who died.
